NOVELTY - Production of a library of materials in the form of a two dimensional matrix in the surface region of a flat substrate comprises spraying two different material components from at least two spray nozzles at a distance from the substrate onto the same side of the substrate so that materials with different compositions can be obtained in different surface regions of the substrate.

- DETAILED DESCRIPTION - An INDEPENDENT CLAIM is also included for a process for testing libraries of materials comprising investigating single defined sites of the substrate and analyzing the composition of the sites.

- Preferred Features: The sprayable material components are selected from solutions, emulsions, suspensions or powders of group IB, IIB, IIIB, IVB, VB, VIB, VIIB or VII, lanthanides, actinides, IA, IIA, IIIA, IVA, VA, VIA elements.

- USE - For forming a library of materials in the form of a two dimensional matrix in the surface region of a flat substrate.

- ADVANTAGE - The process can be easily carried out. (Dwg.0/0)
